

Climate Change Policy

Vision

To be a long term and diversified energy supplier by being appropriately responsive to climate change imperatives.

Beliefs

- Climate Change response is an important aspect of our business that presents both challenges and opportunities.
- Our greenhouse gas emissions can be reduced, mitigated and offset.
- Coal will remain a significant energy source in a carbon constrained future and as such low emission technologies are essential.

Guiding Principles

1. Climate change actions are integrated into our business.
2. Measurement and reporting of emissions is accurate, reliable, robust and transparent.
3. The direct and indirect impacts of a carbon price are known.
4. Our carbon liability is managed.
5. Emissions abatement opportunities and innovations are identified, evaluated and implemented, if appropriate.
6. Energy efficiency is continually improved.
7. Accounting for greenhouse and energy is undertaken.
8. Performance is accurately assessed and reported.
